

LAKE CANIA REVIEW JUNE 2025

INFORMATION RATING

Stocking group: Cania Dam Fish Stocking Association

Species stocked: Australian Bass, Golden Perch, Silver Perch, Southern Saratoga

Stocking timeframe: 2014-2023

Fish timeframe: 2016-2025 Jan-Jun

Fisher timeframe: 2021-2025 Jan-Jun

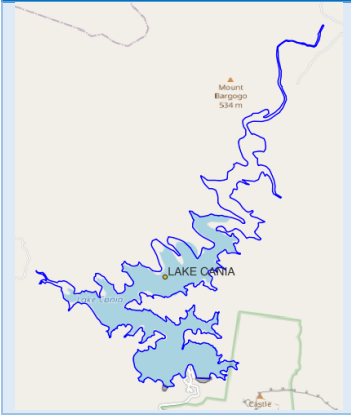

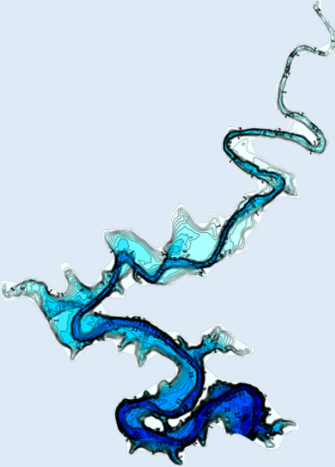

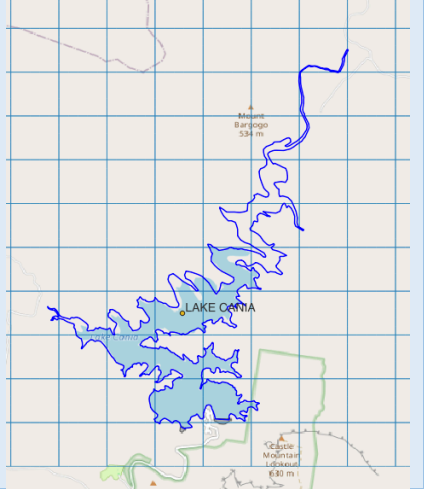

DPI link: <https://www.daf.qld.gov.au/rsa/sips-dams-and-weirs/profile?dam=cania-dam>

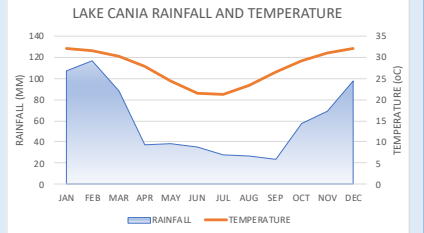

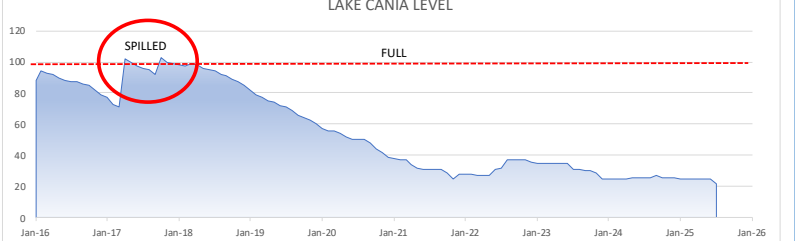

Lake Cania has been regularly stocked with Australian Bass, Golden Perch and Silver Perch. While Bass and Golden Perch have been stocked in large numbers the ratio of fish tagged is 75 Bass to 3 Golden Perch per 10,000 fingerlings stocked. There is also a population of Saratoga in the lake that is increasingly being targeted.

The SIPS competition saw an upsurge in fishing activity with increases in both tagger effort and recaptures. Based on where recapture fishers live Cania is mainly a visitor fishery and attracts fishers from a catchment that extends from Mackay in the north to Victoria in the south with most from central and southern Qld from over 100km away. Fishers from central Qld centres appear to fish Cania over a weekend (43% are weekend recaptures) and this is often a family or group affair with Cania having the highest percentage of recaptures by female fishers at 30%. There is a peak in days fished in Mar, a quieter period over winter and then increased activity from Aug-Oct.

The tagger catch rate for Bass has fluctuated over the past decade from a high of 15.0 fish tagged per day in 2019 to a low of 2.5 in 2023 and is currently 15.8 in the first half of 2025. The level of trophy fish over 500mm tagged remains very low while the average length of Bass tagged is currently 274mm and the lowest average length in the past decade. The longest time out for a Bass after tagging is mostly around 10 years however 1 fish was recaptured after 11.9 years.

Unlike Bass lakes further south Cania did not spill in 2022 and hasn't spilled since 2017. This year the level has remained steady at around 25%. There were 2 Bass recaptured after the lake spilled in 2015 and again in 2017. Both fish were recaptured around Monto by local fishers.

Data sources

Data used in the Lake Cania Crystal Bowl are:

- Tag records and recapture records for the impoundment at <http://crystalbowl.infofishaustralia.com.au/>.
- Dam level data from Sunwater <https://www.sunwater.com.au/water-data/historical-dam-capacity/>.
- Stocked fish records from Fisheries Queensland and from <https://www.data.qld.gov.au/dataset/queensland-freshwater-fish-stocking-records/>.
- Rainfall records from Station 03922 Cania Gorge Park and temperature records from 039104 Monto Township from <http://www.bom.gov.au/climate/data>.

Basis for analysis

- Data reliability for fishers based on the sample size over the past 5 years for days fished by taggers and by fishers recapturing fish.
- Data reliability for fish based on average number of fish tagged and recaptured per year over the past 5 years.
- Catch rates calculated as number of fish tagged/fisher day for taggers with a minimum of 12 fisher days (at least 1 per month) to provide a reliable catch rate.
- Undersized Bass and Golden Perch are <300mm, legal fish are ≥300 and <500mm and trophy fish are ≥500mm.
- Undersized Saratoga are <500, legal are ≥500 and <800 and trophy fish are >800.
- Growth calculated using logarithmic curve from recaptures where fish were less than 300mm, out for 90 days or more and had positive growth.
- Locations based on Infofish grid map LCG for the impoundment and other grid maps where fish were recaptured outside the impoundment.
- Survival rates are calculated based on a model that uses the reduction in the number of recaptures each year after tagging.
- Distance moved was the shortest distance by water between the tag and recapture location measured in Google Earth.
- Travel proxy distance is the distance between where the fisher lives (address, suburb, town or postcode) and the recapture location. Local <60km, intrastate Qld elsewhere, interstate other than Qld.
