

BOWLING GREEN BAY ESTUARIES REVIEW 2025

INFORMATION RATING

Key species: Barramundi, Barred Javelin, Mangrove Jack

Fish timeframe: 2016-2025

Fisher timeframe: 2021-2025

The data are below the preferred reliability level however still provides useful data from the area.

BOWLING GREEN BAY ESTUARIES OVERVIEW

Summary of 2025

- Bowling Green Bay tagging continued at a low level this year so the information needs to be treated with caution.
- Stocking has been used to supplement the Barramundi population in the Haughton River and has previously been undertaken in the freshwater lagoons.

Bowling Green Bay estuaries include the Haughton River, Barratta Creeks, Morrisey Creek, Sheep Station Creek and other small creeks. The waterways are heavily modified, particular in the freshwater reaches which are mostly a series of lagoons.

Bowling Green Bay estuaries are mostly fished by local fishers who account for 77% of recaptures while visiting fishers are mainly from southern parts of the state. Most of the local fishers live in Townsville to the west and the Ayr-Home Hill area to the east.

Fishing occurs throughout the year with a slight peak at the start and end of the Barramundi season from Feb-Oct. It mostly occurs on weekends with 56% of tagger days and 41% of recapture fishers days on weekends.

Like many locations on the east coast Barramundi are a key target species accounting for 65% of fish tagged. Other key species tagged are Barred Javelin and Mangrove Jack which account for a further 12% and 4% of fish tagged respectively. These species account for 81% of the fish tagged.

The area is primarily a harvest fishery with low levels of legal fish tagged and 74% of legal Barramundi caught during the open season by recfishers (other than taggers) being kept. Data are not available for other species however it is likely that a high proportion of legal fish are kept.

The Cungulla Fishing Club stocked tagged Barramundi into Giru Weir from 2013-2017. The recapture rate for these fish so far is 1.1% compared with 6.3% for wild fish which suggests the survival rate for stocked fish is less than that for wild fish.

Data sources

Data used in the Bowling Green Bay Crystal Bowl are:

- Tag records and recapture records for the area at <http://crystalbowl.infofishaustralia.com.au/>.
- Haughton River flow data from station 119003A at Powerline from <https://water-monitoring.information.qld.gov.au/>.
- Rainfall data from Powerline TM Station 033280 and temperature data from Ayr DPI Research Station 033002 from <http://www.bom.gov.au/climate/data/>.

Basis for analysis

- Data reliability for fishers based on the sample size over the past 5 years for days fished by taggers and by fishers recapturing fish.
- Data reliability for fish based on average number of fish tagged and recaptured per year over the past 5 years.
- Catch rates calculated as number of fish tagged/days fished.
- Recapture rates relate to fish tagged in a particular year.
- Undersized Barramundi are <580mm, legal-trophy fish are >=580 and <1000mm and trophy fish are >=1000mm. Legal fish are 580-1200mm.
- Undersized Barred Javelin are <400mm, legal-trophy fish are >=400 and <600mm and trophy fish are >=600mm.
- Undersized Mangrove Jack are <350mm, legal-trophy fish are >=350 and <5600mm and trophy fish are >=500mm.
- Locations based on Infofish grid maps BGB, MCT, CRM, BGC, BRN, UHR and other grid maps where fish were recaptured outside the area.
- Travel proxy distance is the distance between where the fisher lives (address, suburb, town or postcode) and the recapture location. Local <80km, intrastate Qld elsewhere, interstate other than Qld.
